

Validating Secondary Research Through Empirical Testing

NewDia is struggling with retaining customers and converting interested individuals into customers

NEWDÍA Company Overview

11,200 sq. ft Cannabis Mall in Fenway

Experience-Driven Retail

Cultural Nexus

Community Focus

Broad Product Portfolio: Flower, Pre-Rolls, Concentrates, Edibles

Problem Statement

- Newdia primarily serves **college students, Red Sox fans**, and **local residents**, shaping its product and marketing approach.
- With a **66.7% conversion rate**, **1 in 3 visitors leave without making a purchase**, indicating room to optimize in-store experience, pricing, or product selection.
- While Newdia has returning shoppers, their purchases lack engagement or loyalty, highlighting a **need for retention strategies** beyond just discounts.

Secondary research and interviews suggest that NewDia should enhance the customer experience across various channels

Product

- Pricing & promotions: Benchmark against competitors' prices, deals and consumers' willingness to pay.
- Subscription-based option: Consider a subscription model for repeat customers, allowing them to receive products on a scheduled basis with potential discounts or perks.
- Exclusive product drops: Introduce limited-edition strains to differentiate from competitors.

Marketing

- Target promotions to specific consumer segments: Develop tailored marketing campaigns for each target audience (e.g. students, skateboard/street YA, post-game/concert-goers).
- Personalized SMS/email notifications: Remind customers when their favorite products are back in stock to encourage repeat purchases.

Offline (In-Store)

- Optimize storefront and interior signage: Improve signage placement and messaging to enhance awareness, guide customers effectively, and highlight promotions.
- Enhance in-store experience: Introduce (sensory- smell, feel. etc.) testers and/or samples.
- Loyalty incentives or facilitate delivery during off season to counteract low foot traffic.

Online (Website)

- Improve checkout conversion: Investigate drop-off points in the buying process.
- Boost product categories: Flower, vaporizers, edibles, and pre-rolls should be prominently featured.
- Optimize the blog strategy: Blogs have low engagement; consider integrating them into popular pages.

After the workshop, we refined our survey for clarity, relevance & deeper customer insights

The feedback from the Survey Workshop helped us understand that:

- Some questions were unclear or too detailed, which affected the quality and completeness of responses
- Including shoppers, rather than only non-shoppers, will enable us to capture a more complete and relevant picture of the customer journey.

Therefore, we made the following changes:

- Added targeted questions for respondents who made a purchase to gather more actionable insights
- Refined answer options for clarity and conciseness, enhancing respondent experience
- Reworded questions to clearly specify which store visit was being referenced
- Reorganized questions related to in-store assistance to improve logical flow and comprehension
- Removed sensitive demographic questions, such as income, to increase response comfort
- Clarified that providing an email address is optional and solely for voucher delivery

We established a clean and representative dataset to strengthen the validity of our findings

Target Audience

- Current or recent visitors of NewDia's store in Fenway
- Particularly interested in those who did not make a purchase

Respondents Breakdown

Source:

- 77% through survey link
- 23% through QR code

Gender:

- 58% male
- 42% female

Age:

- 21-24 (44%)
- 25-34 (39%)
- 35-44 (11%)
- Others (6%)

Occupation:

- 67% students
- 28% employed
- 3% unemployed
- 2% retired

1

Data Collection

- Data collection timeframe: April 16 to 22
- Shared survey through NewDia's newsletter
- Posted survey link in MBA WhatsApp group
- Displayed QR code in-store for customers to scan and complete survey
- Had a team member actively encouraging customers in-store to participate

2

Data Cleaning

- Removed 8 out of 63 responses due to poor quality (e.g., rushed, incomplete, or unhelpful entries)
- Extracted and removed a column containing email addresses to ensure participant privacy
- Separated multi-item text entries into lists, then removed those columns to simplify analysis

Impact of Customer Segmentation

Age and employment status drive purchase behaviour

Variables

- Dependent Variable (DV): purchase_today
- Independent Variables (IV): age_group_num, gender_num, occupation_num, location_num

Test method

- Multivariable Logistic Regression (*Exhibit 1*)

Hypothesis

- Age, gender, occupation, and location each have a significant impact on whether a customer makes a purchase at NewDia.

Findings

- The model's **Pseudo R² of 0.26** indicates a good fit for predicting purchase behavior based on demographics, especially age and occupation.
- **Age | Coefficient: -2.33, p = 0.007**: As age increases, customers are significantly less likely to make a purchase.
- **Gender | Coefficient: +0.53, p = 0.476**: No significant effect – men and women purchase at similar rates.
- **Employment Status | Coefficient: +3.80, p = 0.002**: As occupation goes from student → employed → unemployed → retired, the log-odds of purchase go up,, which means that they are more likely to buy.
- **Location | Coefficient: +0.15, p = 0.659**: Location (e.g., coming from outside Boston or an event) does not significantly affect purchase behaviour.

Implications

- Younger customers (ages 21–34) and those who are employed are the most likely to convert – focus promotions, sampling, and loyalty pitches here.
- Students and older age groups may benefit from more education or entry-level deals to drive engagement.
- Gender and location are not strong predictors of purchase, so avoid over-targeting based on these traits.
- Bundle discounts or loyalty perks around employment triggers (e.g., “Work Perks Wednesdays” for employed customers) to tap into the most purchase-ready segment.
- Test referral programs targeting younger buyers – since they're more likely to purchase, incentivizing them to bring in peers could drive word-of-mouth growth.

Returning visitors were significantly more likely to make a purchase compared to first-time visitors

Variables

- Dependent Variable (DV): Purchase Today (Q1)
- Grouping Variable: First-Time vs Returning Visitor (NewDia_first_time)

Test method

- Independent Samples T-Test (*Exhibit 2*)

Hypothesis

- Returning visitors are more likely to purchase today than first-time visitors.

Findings

- First-Time vs Returning Visitor: Returning visitors showed a significantly higher purchase rate (+28.9%) compared to first-timers. The difference was statistically significant ($p = 0.046$), with a moderate effect size (Cohen's $d = -0.609$)

Implications

- Loyalty Building: Focus on nurturing first-time visitors into loyal repeat customers to maximize revenue.

Visit reason and cannabis consumption showed no significant impact on purchase behavior

p = 0.450

The result was not statistically significant (*Exhibit 3*).

Customers visiting for a specific product were 22% more likely to purchase than recommendation seekers. Although $p = 0.450$ (not significant), the effect size (Cohen's $d = -0.439$) suggests a promising trend.

p = 0.453

The result was not statistically significant (*Exhibit 4*).

Cannabis consumers who interacted with discount prompts had a higher purchase likelihood. Despite $p = 0.453$ (not significant), the effect size (Cohen's $d = 1.119$) indicate meaningful marketing potential.

There was no significant difference between younger and older customers noticing signage

Variables

- Dependent Variable (DV): Signage_noticeable
- Grouping Variable: Age Group: Younger vs Older (age_young_old)

Test method

- Independent Samples T-Test (*Exhibit 5*)

Hypothesis

- Older customers notice store signage more than younger customers.

Findings

- Age vs Signage Noticeable: No significant difference between younger and older customers noticing signage ($p = 0.785$), but a large effect size (Cohen's $d = 1.233$) suggests age-targeted signage strategies could still be explored.

Implications

- Signage Strategy: Although not statistically significant, signage design testing segmented by age group could enhance visibility and engagement.

Impact of Staff Assistance

Experiment: Control Group

On a typical visit, how likely are you to make a purchase at NewDia?

Extremely unlikely	Somewhat unlikely	Neutral	Somewhat likely	Extremely likely
☐	☐	☐	☐	☐

Experiment: Test Group

On a typical visit, if a store associate provides the following assistance to you, how likely are you to make a purchase?

	Extremely unlikely	Somewhat unlikely	Neutral	Somewhat Likely	Extremely Likely
Cannabis Product Guidance/Education	☐	☐	☐	☐	☐
Store Navigation Assistance	☐	☐	☐	☐	☐
Product Demonstrations or Samples	☐	☐	☐	☐	☐
Information about Promotions or Discounts	☐	☐	☐	☐	☐

We split the respondents into a control and treatment group to better understand purchase decisions

1 Data Collection

- Conducted a between-subjects experiment to test if staff navigation assistance influences purchase likelihood.
- Participants randomly answered one of two questions:
 - Q9 (Control): Likelihood of purchase (no staff assistance)
 - Q10 (Treatment): Likelihood of purchase with store navigation assistance
- Responses used a 5-point Likert scale (1 = Extremely Unlikely, 5 = Extremely Likely).

2 Data Preparation

- Combined Q9 and Q10 into a new variable: combined_likelihood.
- Treated group_assignment as a dummy variable to conduct regression analysis:
 - 0 = Control Group (no staff assistance)
 - 1 = Treatment Group (with store navigation assistance)

3 Data Processing

- Final sample: 54 participants
 - Each participant responded to only one question (either control or treatment)
- Used simple linear regression:
 - Predictor: Group assignment (0 = control, 1 = treatment)
 - Outcome: Purchase likelihood
- Focused specifically on navigation assistance to isolate its effect on purchasing behavior.

Staff assistance framing had no significant effect on purchase intent

Variables

- Dependent Variable (DV): combined_likelihood (Q9 and Q10)
- Independent Variable (IV): group_assignment (Q9 and Q10)

Test method

- Simple Linear Regression (*Exhibit 6*)

Hypothesis

- Participants who were prompted with store navigation assistance (treatment group) will report a higher likelihood of making a purchase than those who were not (control group).

Findings

- Purchase Likelihood = $4.357 - 0.396 \times \text{Group Assignment}$
- Participants prompted with store navigation help reported, on average, a 0.396-point lower purchase likelihood ($b_1 = -0.396$).
- Group assignment explains only 3.7% of the variation in purchase likelihood ($R^2 = 0.037$).
- The result was not statistically significant ($p = 0.165$) — prompting about navigation did not significantly change purchase likelihood.

Implications

- Navigation help alone may not be a strong driver of purchase intent at NewDia.
- NewDia should pair navigation support with strategies like personalized recommendations, promotions, or loyalty programs to better influence buying behavior.

There was also no significant impact from additional staff assistance frames

Difference in Purchase Likelihood based on Product Guidance and Education

p = 0.235

The result was not statistically significant (*Exhibit 7*).

Prompting customers with cannabis product guidance or education did not significantly increase purchase intent compared to the general framing.

Purchase Likelihood=4.357-0.319×Group Assignment

Difference in Purchase Likelihood based on Product Demonstrations or Samples

p = 0.365

The result was not statistically significant (*Exhibit 8*).

Prompting customers with product demonstrations or samples did not significantly increase purchase intent compared to the general framing.

Purchase Likelihood=4.184-0.242×Group Assignment

Difference in Purchase Likelihood based on Discounts

p = 0.857

The result was not statistically significant (*Exhibit 9*).

Prompting customers with promotions or discounts did not significantly impact purchase intent compared to the general purchase framing.

Purchase Likelihood=4.357-0.049×Group Assignment

Promotions impact purchase likelihood more than store navigation help for those who received staff assistance

Variables

- Purchase Likelihood (Q10)
- Store Navigation Assistance (Q10)
- Info about Promotions/Discounts (Q10)

Test method

- Paired Samples T-Test (*Exhibit 15*)

Hypothesis

- Customers are equally likely to make a purchase whether they receive store navigation assistance or promotional/discount information.

Findings

- Providing customers with information about promotions or discounts has a significantly greater impact on purchase likelihood than providing store navigation assistance ($p = 0.036$).

Implications

- Emphasizing promotional offers could be a more effective strategy for driving purchases at NewDia.

Impact of Loyalty Program

Loyalty enrollment does not significantly impact purchase decision

Variables

- Loyalty Enrollment (Q18)
- Purchase Today (Q1)

Test method

- Chi Squared Test (*Exhibit 17*)

Hypothesis

- Customers are more likely to make a purchase if they are enrolled in NewDia's loyalty program.

Findings

- The relationship between enrollment in NewDia's loyalty program and purchase rate is not significant ($p = 0.804$).

Implications

- Since loyalty enrollment does not significantly impact same-day purchase rates, efforts to drive immediate purchases should focus on other factors, such as staff interaction, promotions, or in-store experience, rather than loyalty program enrollment alone.

Impact of First Impression

Moderate negative correlation suggests early perceptions influence buying decisions

Variables

- Purchase Likelihood (Q9)
- First Impression (Q15)
 - Participants' initial impression
 - Scale: 1 – calm, 2 – excited, 3 – neutral, 4 – overwhelmed, 5 – uncomfortable

Test method

- Correlation (*Exhibit 21*)

Hypothesis

- Customers' first impression when visiting the store impacts the likelihood of making a purchase.

Findings

- There is a moderate negative correlation between first impression and purchase likelihood ($r = -0.373$).
- The result was statistically significant ($p = 0.051$) — as first impression rating becomes more negative (higher rating in question), purchase likelihood tends to decrease (or vice versa).

Implications

- First impression is important to convert visitors into buying customers.
- However, we need to collect more data, especially as we could only use the data from half of the respondents (only the control group answered the question).

Summary of Key Findings

NewDia needs to adopt a more holistic strategy to drive higher in-store conversion

Prioritize High-Conversion Segments: Younger & Employed Shoppers

- Shoppers aged 21–34 and those who are employed are most likely to purchase. Focus on promotions, sampling, and loyalty offers on this group.
- Gender and location were not strong predictors — avoid wasting resources on demographic over-targeting.
- Surprise: Employment status outperformed traditional demographic factor.

Action: Initiatives like “Work Perks Wednesdays” or referral programs for young buyers could unlock further growth.

Promotions & Specific Intent Drive Purchases

- Discount prompts had a large effect size, even without statistical significance – showing strong marketing potential.
- Visitors with specific purchase intent were 22% more likely to buy than those browsing or asking for recommendations.
- Surprise: General recommendations and education had no significant effect on purchase intent.

Action: Emphasize clear promotions and highlight popular items to capture ready-to-buy customers.

Loyalty & Navigation Need Strategic Support

- Loyalty enrollment didn’t boost same-day purchases — focus short-term efforts on staff interaction and in-store experience instead.
- Navigation assistance alone didn’t drive purchases. Combine it with offers, product demos, or personalized recommendations.
- Signage and first impressions matter, but early data is limited.

Action: Continue testing signage and collect more first-visit data to validate.

Reflection

*Thank
You*

Chi-Squared Test: Impact of Loyalty Enrollment on Same Day Purchase Rates

Exhibit 16

purchase_today * loyalty_enrolled Crosstabulation					
			loyalty_enrolled		Total
			No	Yes	
purchase_today 0	Count		1	13	14
	Expected Count		1.2	12.8	14.0
Yes	Count		1	9	10
	Expected Count		.8	9.2	10.0
Total	Count		2	22	24
	Expected Count		2.0	22.0	24.0

Chi-Square Tests					
	Value	df	Asymptotic Significance (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.062 ^a	1	.803		
Continuity Correction ^b	.000	1	1.000		
Likelihood Ratio	.062	1	.804		
Fisher's Exact Test				1.000	.670
Linear-by-Linear Association	.060	1	.807		
N of Valid Cases	24				

a. 2 cells (50.0%) have expected count less than 5. The minimum expected count is .83.
b. Computed only for a 2x2 table

p = 0.804 ; not significant

Chi-Squared Test: Impact of Gender on Same Day Purchase Rates

Exhibit 17

purchase_today * gender_num Crosstabulation					
			gender_num		
			Female	Male	Total
purchase_today	0	Count	15	20	35
		Expected Count	14.9	20.1	35.0
	Yes	Count	8	11	19
		Expected Count	8.1	10.9	19.0
Total		Count	23	31	54
		Expected Count	23.0	31.0	54.0

Chi-Square Tests					
	Value	df	Asymptotic Significance (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.003 ^a	1	.957		
Continuity Correction ^b	.000	1	1.000

		Expected Count	24.0	22.0	4.0	2.0	2.0	54.0

Chi-Square Tests

	Value	df	Asymptotic Significance (2-sided)
Pearson Chi-Square	1.829 ^a	4	.767
Likelihood Ratio	2.453	4	.653
Linear-by-Linear Association	.019	1	.890
N of Valid Cases	54		

a. 6 cells (60.0%) have expected count less than 5. The minimum expected count is .70.

p = 0.767 ; not significant

Correlation: Testing the relationship between Purchase Likelihood and First Impression

Exhibit 21

Correlations		e1_purchase_l ikelihood_num	first_impressio n
e1_purchase_likelihood_n um	Pearson Correlation	1	-.373
	Sig. (2-tailed)		.051
	N	28	28
first_impression	Pearson Correlation	-.373	1
	Sig. (2-tailed)	.051	
	N	28	54

Follow-Up Survey Questions

No	Question	Response Options
1	If you interacted with a store associate today, what type of assistance did they provide?	Open-ended response
2	What kind of assistance do you typically want from a store associate?	• Help finding products • Advice/recommendations • Checkout assistance • Other (please specify): _____
3	How would you rate NewDia’s pricing compared to other cannabis retailers?	• Much lower • Slightly lower • About the same • Slightly higher • Much higher
4	In addition to NewDia, which other cannabis stores have you visited in the past 3 months?	Open-ended response
5	Was there a specific product you were hoping to find today that wasn’t available?	• Yes (please specify): _____ • No

Follow-Up Survey Questions

No	Question	Response Options
6	Which of these would improve your next store visit the most?	• Faster service • Better product availability • More knowledgeable staff • More promotions/discounts • Other (please specify): _____
7	How did you hear about Newdia?	• Social Media • Word-of-mouth • Walked by the store • Advertisement • Other (Open-ended)
8	How likely are you to recommend NewDia to a friend?	• Extremely Likely • Likely • Neutral • Unlikely • Extremely Unlikely

Reflections and Learnings

AI proved to be a valuable tool for enhancing efficiency, particularly in refining wording and formatting citations. However, personal oversight remains essential to ensure quality, accuracy, and appropriate context. Ultimately, reviewing and editing AI-generated suggestions carefully is crucial to maintain the integrity and intent of our work.
